The company

PHILOSOPHY

HBS bases its development on the singergy with the customer Since 1967 HBS Group operates in the production and marketing of hydraulic and electromechanical components. The constant search for technical solutions, the constant improving the quality of product and process, in addition to the efficiency and flexibility of the production allow **HBS** to the continued success in the global market. The presence of **HBS** with unit production and trade in different continents, alongside a qualified distribution network, provides customer assistance it needs.

HBS is your partner for the development and supply of hydraulic components and electromechanical. With its technical staff **HBS** is able to realize and customize, in synergy with the customer, highly innovative solenoid operated valves for each type of use, from transport to construction, from construction machinery to agriculture, from ecology to industrial systems.

TUV NORS Na Markan States States

R&D

HBS is able to anticipate the needs of the changing market and to develop customized products

Application fields

INNOVATION

HBS is one truth in a position to forerunning the needs of a market in constant evolution

HYDRAULIC MOTORS MOBILE CRANE EXCAVATOR EQUIPMENT DRILLING RIGS AERIAL PLATFORMS EXCAVATORS CRANE BASKETS HOOK CONCRETE PUMPS TELEHANDLER

To choose technology HBS, mean to entrust themselves to a sure, synonymous partner of quality in the lift. For this we put to disposition know how of our engineers and our technicians who place side by side the customers in the planning, in the study and the search of new solutions.

Thanks to the high level of experience acquired by its personnel, **HBS** personalised design and planning, and high level professional consulting for the installation of systems are guaranteed. With the unit planning, **HBS** in a position to devising, realizing and to personalize, in synergy with the customer, valves and hydraulic components highly innovated for every kind of employment, from the transports to the earth movement, from the building to agriculture, the ecology to the industrial systems. **HBS** bases the principle of its own development upon synergism with the costumer.

Introduction

PRODUCTION RANGE

The HBS S.p.a production range includes different types and styles of valves, manufactured to be considered as standard items, therefore they cannot be considered as partial machines or safety components and for this reason they are excluded from the domain of the EEC European Directive 2006/46/CE.

The HBS valves cannot be used on the machine until the complete machine has been verified to be compliant with the requirements of the EEC EUROPEAN DIRECTIVE 2006/46/CE.

CARTRIDGE VALVES

This valves must at all times be installed into specified cavities as shown in the HBS catalogue. The valves can be mounted directly into the actuator body or external inline bodies. The internal components of the valves are made in hardened steel. Please refer to the assembly torques figures shown in this catalogue to secure the valves into the cavities in the manifolds. In case the cartridges are not being used in steel or aluminium manifolds, or with different external coating from the treatment used by HBS, please contact our technical department for the relevant new torque values. To ensure the correct performances of the cartridge valves, cavities must correspond to the catalogue's indications and be absolutely cleaned to ensure that there are no markings or burs left on the surfaces before fitting the valves. Lubricate the cartridge seals before assembling, insert the cartridge manually and screw it until the operator feels the seals resistance.

Lock the cartridge with a torque wrench and set the valve on the test rig. After final testing please check again the torque setting.

INTEGRAL VALVES WITHIN MANIFOLDS OR BODIES

They basically consist of a steel body with a cartridge. The valve housing is normally manufactured in steel or upon request from an aluminium extruded bar. Steel bodies are available with external anticorrosion protection treatment with zinc coating. Aluminium bodies are only suitable to be used in applications where the max pressure is rarely reached or with low working frequency (max 60 cycles per day). On request the manifolds can be supplied with black anodizing treatment. Other colours available on request. In general the valves in manifolds have the ports for the connection into the hydraulic circuit. The ports are normally BSPP types. Other ports are available upon request such as valves which are also available in flangeable version with SAE 3000 or SAE 6000 ports. All types of valves, cartridges or in bodies, are fitted with NBR or Buna-N seals, suitable for working with temperatures between -20°C and +90°C. Viton seals are available on request. Should the valves be used above the temperature range indicated, please contact our technical department. The mounting position for the valves is unrestricted.

FLUIDS - FILTERING - LEAKAGE

HBS valves are designed to work with Mineral Oil for all standard hydraulic equipments such as pumps, motors, cylinders. In order for the correct function of the valves it is essential that the filtration of the oil is kept to the levels of filtration stated between NAS 8 and 11. (see chart). HBS recommends these max contamination levels as follows:

Valve - Application	ISO 4406	NAS
Valves used with pressure over 250 bar, with internal pilot connections, or with continous duty	17/14	8
Valves for intermitted cycles or pressure up to 250 bar	18/14	9
Valves to be used below 100 bar	19/16	11

HBS valves have metallic seats without seals. They can produce a very low oil leakage path across the seats. Some of them can show a maximum leakage of 5 drops per minute (1 cm3 = 20 drops) without any fault in their performances.

SETTINGS

The setting values in the catalogue are referred to as using and hydraulic oil with a viscosity of 16 Centistokes at flow rate of 5l/min. HBS test rigs have a minimum filtration level of NAS 8.

STORAGE

Valves should be kept only in rooms with temperature ranges between -5°C and +45°C. Protect the valves from the direct sun light and from sources of ozone atmosphere and do not remove the original plastic wrapping to avoid entrance of contamination and to keep the internal components oiled and protected.

PERFORMANCE CURVES

The curves illustrated in the catalogue pages are referred to the test made by HBS. However small differences in practice do not affect the performances and reliability of the valves. The curves available for every valve are obtained utilizing mineral oil with vioscosity of 16 cSt, 50°C of temparture, and 20°C of ambiental temperature. It is Customer's responsibility to test an appropriate number of samples to prove the correct function of the valves. The working condition of the Customer's machines cannot be completely simulated during our approval tests on our in-house test rigs. HBS confirms that all its products are individually tested during the production and controlled according to the internal quality procedure. Valves have to be used for the application and in respect of the technical specification shown in the catalogue.

Solenoid operated valve normally closed

NO REVERSE FLOW ENERGIZED

NC (normally closed) valve, with deenergized coil, works as a check valve locking oil flow from 2 to 1 and allowing free flow from 1 to 2. Energizing the coil the poppet opens the 2 to 1 flow path. They are normally used in high pressure circuits as check valves or to ensure the static lock of a load.

REVERSE FLOW ENERGIZED

NC (normally closed) valve, with deenergized coil, works as a check valve locking oil flow from 2 to 1 and allowing free flow from 1 to 2. Energizing the coil the poppet opens the flow path in both ways. They are normally used in high pressure circuits as check valves or to ensure the static lock of a load.

DOUBLE LOCK

NC (normally closed) valve, with deenergized coil, works as a check valve locking oil flow from 2 to 1 and from 1 to 2. Energizing the coil the poppet opens the flow path in both ways. They are normally used in high pressure circuits as check valves or to ensure the static lock of a load.

Solenoid operated valve normally open

NO REVERSE FLOW DE-ENERGIZED

NA (normally open) valve, with deenergized coil, allows free oil flow from 2 to 1. Energizing the coil the poppet closes the 2 to 1 path interrupting the oil flow and allowing flow only from 1 to 2, the valve works as a check valve. They are normally used in high pressure circuits as check valves or to ensure the static lock of a load.

REVERSE FLOW DE-ENERGIZED

NA (normally open) valve, with deenergized coil, allows free oil flow from 2 to 1 and viceversa. Energizing the coil the poppet closes the 2 to 1 path interrupting the oil flow and allowing flow only from 1 to 2, the valve works as a check valve. They are normally used in high pressure circuits as check valves or to ensure the static lock of a load.

DOUBLE LOCK

NA (normally open) valve, with deenergized coil, allows free oil flow from 2 to 1 and viceversa. Energizing the coil the poppet closes the path interrupting the oil flow in both ways, the valve works as a check valve. They are normally used in high pressure circuits as check valves or to ensure the static lock of a load.

Solenoid valve - 2 way - 2 pos. - norm. open

Continuous duty coil

formula:

 $T_{amb} + \Delta T < T_{max}$

demand.

where

 T_{amb} = ambient temperature ΔT = temperature increase due to the operation

The various versions of the coil allow use

in both AC and DC. Coils with different voltages and with DIN43650, AMP JUNIOR and DEUTSCH connectors are also available in the catalogue or on-

Heat insulation class: H (T_{max} = 356°F)

Ambient temperature range: -86+140°F

In order to use the coil in continuous

service you must respect the following

T_{max} = maximum allowable temperature

Inlet voltage fluctuation must not exceed ±10% of nominal voltage to guarantee correct operation and long life of coil.

HBS

ORDERS

Any order must be sent in writing to HBS S.p.a and filled with the following: full name, address and fiscal data of the Customer, the delivery of material and documents address if different from the invoice address, order number, note of any special offer or agreement which must be still valid at time of ordering, despatch date, exact quantities and delivery date, the courier and the payment terms. The order must show the HBS codes, it is not sufficient to only use the sole Customer code or reference.

HBS S.p.a. reserves the right to decline the order or to request for integration if it is considered incomplete; in case there is not positive feedback within 7 days form the written order confirmation the Customer has to consider the order not confirmed. Any verbal agreements with HBS personnel or resellers must be always followed by a written confirmation by HBS s.pa.

WARRANTY

HBS guarantees the original products are free from defects in workmanship or material for a period of 12 months from the installation date on the machine documented by time incontrovertible and unalterable elements. The warranty is valid since when the valves have been installed, and operated in accordance to the HBS use and technical details. They must be assembled on the machine within 6 months from the date stamped on the valve, in lack of proof documentation about the real installation date, warranty will start from this last term, also if preceding the installation.

External seals are not covered by the warranty. The warranty is referred only to the original purchaser and lapses in case of manumission, any modify without written permission, improper use or fluid pollution. The warranty request has to be notified directly to HBS, in a completed written report with the fault indicated. The valves can be returned to HBS only after written acceptance by HBS. HBS will only replace or repair the valves after the explicit authorization from our technicians at the HBS premises, or if agreed by HBS at the Customer's site too. HBS do not provide a refund or credit against any costs of disassembling, repairing, replacing or loss of profit for the machine out of work.

Recall Campaign: HBS shall only agree to recall products where there is evidence of re-occurring faults. HBS will not be liable in cases where the valves are used on machines where they are capable of producing damages much greater than the production costs to third persons.

Also it is always the responsibility of the Customer to take all necessary safety measure during the design of the machines or hydraulic circuits to ensure avoidance of such damages or injuries. Warranty includes only elements bought and sold by HBS; HBS is not liable for indirect damages.

JURISDICTION

HBS S.p.a reserves the right to stop the production or to modify the dimension or technical feature of its production shown in this catalogue without any prior warning or obligation. Customising of HBS products, will only be modified after the agreement with the Customer. In case of disagreement between parties the production can be stopped at any time. Without any written permission partial or total reproduction of this catalogue is strictly prohibited.

In case of any disputes the sole jurisdiction for any settlement is referred to the Law Court Of Mantova.
